

Session 1 task

Task Description:

Create a Python script that calculates the total cost of items in a store and compares it with a given budget. The script should also calculate how much money is left or needed to reach the budget.

Python Task Example:

1. Define variables for the prices of three items.
2. Define a variable for the total budget.
3. Calculate the total cost of the items.
4. Compare the total cost with the budget.
5. Calculate the difference (either how much money is left or how much more is needed).
